

LAUREL BRIDGE

Orchestrating Medical Imaging Workflow

Seamlessly Integrate Medical Imaging Workflows Across the Enterprise

Laurel Bridge enterprise workflow solutions ensure medical imaging studies are available where and when they are needed, across disparate PACS environments and clinical IT systems.

- Maximize availability of imaging information across multiple PACS and VNA systems.
- Enhance VNA implementations by consolidating information and access.
- Maximize interoperability between VNA and PACS archives, diagnostic or clinical displays and universal viewer or worklist tools.

Navigator™ ensures the correct historical imaging studies are retrieved from PACS and/or the VNA and are available for comparison to the new studies. Prefetching can be triggered by a new exam order.

Compass™ ensures the new studies are stored on the VNA and are associated with the historical studies. Compass also ensures new and historical studies are delivered to the correct diagnostic workstation to support radiologist reading workflow requirements.

Exodus™ or **Navigator™** can manage migration of historical imaging studies to the VNA.
